

Algorithm to set up an ExpressJS Application

Step 1. In your root directory of your project run `npm init` to initialize your project.

Step 2. Create a source(`src`) directory with your main entry file(`index.js`).

Step 3. Initialize nodemon and express to your project(Nodemon is Optional).

Step 4. In your `package.json` file create the necessary scripts required to start your development server, and to start nodemon(Optional) in your project.

Step 5. Test your Project by running `npm start`.

Step 6. import necessary modules needed to run express in your project.

Step 7. Set a port that your project will listen to.
